

THE AI FREEDOM MACHINE — AUTO-PILOT · GETTING STARTED

Welcome — let's set up your Auto-Pilot

The full version: an AI assistant that builds your business *and* runs it for you — creating your content, delivering your sales, texting you each order, and posting on a schedule.

 [Auto-Pilot Edition · Claude Code](#)

This version can run things by itself while your computer is on. It needs two quick, free installs first. Follow along — copy, paste, press Enter.

● What your auto-pilot can do

Builds your business

Designs your product, writes your emails and sales page — all in your voice.

Creates your content

Carousels, reels with text & motion, stories, and posts — designed for you each week.

Posts it for you

Publishes on the schedule you set — you preview first, nothing goes out without your OK.

Auto-delivers sales

When someone buys, it emails them their product automatically.

Texts you every sale

A message on your phone the moment you make a sale.

Weekly summary

A simple recap of sales and revenue, straight to your phone.

 **Autopilot exclusive — your Finance Agent.** A plain-English bookkeeper, built in. It organizes your income & expenses, answers your money & tax questions, and gets you ready for your accountant — from a simple receipt tracker all the way to setting up QuickBooks. (Review-first: it never changes your books without your OK.)

Everything runs only during the working hours you choose, so jobs fire when your computer is on.

● Step-by-step

1

Create your Claude account

Go to claude.ai, click **Sign up**, and choose the **Claude Pro** plan (the subscription that powers your assistant).

2

Open your computer's command window

It's a plain text window — not scary, you just type into it.

- **Windows:** click **Start**, type **PowerShell**, click **Windows PowerShell**.
- **Mac:** press **⌘ + Spacebar**, type **Terminal**, press **Enter**.

3

Install the free engine (Node.js)

1. Go to nodejs.org and click the green **LTS** button.
2. Open the download and click through **Next / Continue** → **Install**.
3. **Close and reopen** the window from Step 2.
4. Check it worked — type this and press Enter:

```
node --version
```

If you see something like [v22.x.x](#), you're golden. 🎉

4

Install your assistant (Claude Code)

In the same window, paste this and press Enter:

```
npm install -g @anthropic-ai/claude-code
```

Let it finish — a minute of scrolling text is normal.

5

Open your assistant inside your business folder

1. Move your **business folder** to your **Desktop**.
2. Type [cd](#) followed by a space, then **drag your business folder onto the window** (it pastes the location), then press Enter.
3. Type [claude](#) and press Enter.
4. The first time, it'll ask you to **sign in** — follow the prompts.

6

Say hello 🗣️

let's get started

Your assistant will ask what hours your computer is usually on (so automations run reliably), then help you build everything and connect your accounts.

💡 **Turning on auto-pilot:** when you're ready, just say *"connect my accounts and go live."* Your assistant walks you through payments, delivery, phone alerts, your customer-service inbox, and content posting — one at a time, testing each as you go. Social posting stays in safe **preview mode** until *you* choose to go live.

🔔 **Paid traffic, when you're ready:** say *"set up my Meta ads for my product."* Your assistant writes the ads, renders the image and reel creative, plans any talking-head ads, and builds the campaign in your own ad account — always **paused**, so nothing spends until you switch it on yourself. After that it checks your numbers once a day and messages your phone with what to keep, cut, or scale. It only ever recommends; you approve every move. *Ads are optional — your content engine runs on \$0.*

💬 **Your inbox, handled:** say *"help me answer my customers."* Once your email is connected, your assistant reads the support inbox, tells you what's waiting, and drafts a warm reply to each in your voice. **You approve before anything sends** — and refunds, complaints, and anything about money always wait for you.

💡 **You're always in control.** Change your working hours, turn anything on or off, or ask "how's it going?" — just say it in plain words, anytime. Nothing runs that you didn't approve.

If you ever hit a usage limit ⌚

Your Claude Pro plan includes plenty for everyday work, but big jobs — building your whole business at once, or a full week of content — use more, and the scheduled automations draw from the same pool. If Claude says you've reached your limit, **nothing is lost**. You have options:

- **Just wait a bit.** Limits reset on a rolling basis (usually within a few hours). Anything scheduled simply picks up on the next run during your working hours.
- **Build in smaller bites.** Do one thing at a time — product first, content later — instead of asking for everything in one sitting.
- **Your work is saved automatically** in your business folder, so you can always continue right where you left off.
- **Know your plan options.** **Claude Pro** (~\$20/mo) is the starting point. Because the scheduled automations draw from the *same* usage pool as your live chats, heavier daily automation uses more — if you regularly hit limits, **Claude Max** steps up: the **5x tier** (~\$100/mo) is five times Pro, the **20x tier** (~\$200/mo) is twenty times. Change tiers anytime in your Claude account; your work carries over. (*Check claude.ai for current pricing.*) Start on Pro and only move up if you keep running out.

Which plan do I need? Any paid plan works — **Pro is enough to start**. Bigger plans don't add features; they give more room for back-to-back big jobs and heavier automation. A good rule: start on Pro, and if the scheduled jobs or big content batches keep hitting the limit, move to Max 5x.

If you get stuck

- The #1 mix-up: forgetting to **close and reopen** the window after installing Node (Step 3). Try that first.
- Make sure you opened the assistant **inside your business folder** (Step 5).
- Once it's running, just tell it what's happening — *"I'm stuck on step 4"* — and it'll help.

The AI Freedom Machine · by AI Systems Method · Automated Version (Claude Code). Your computer needs to be on during your chosen working hours for automations to run.
