

THE AI FREEDOM MACHINE — AUTO-PILOT · WHAT IT CAN DO

Everything your team can do

Fourteen specialists, plus the automations that run while you're not at the desk. Every command, and the plain-English version that works just as well.

Auto-Pilot Edition · Claude Code

You never have to remember any of this. Every command below has a plain-English version that works exactly the same. Type `/meta-ads` or just say *"help me run some ads"* — you'll land in the same place. This page is a map, not a manual. If you only remember one thing, remember `/start-here`.

● Build & launch

Nothing has to be done in order. Start anywhere — your assistant remembers everything and fills in gaps as it goes.

Command	Or just say...	What happens
<code>/start-here</code>	"let's get started"	The front door. Sets your working hours, shows your full menu, and lets you pick anything.
<code>/validate-offer</code>	"test my idea before I build it"	A ten-minute gut-check with a straight Go / Refine / Pivot verdict — before you build the wrong thing.
<code>/guided-setup</code>	"help me build my product"	Builds your product start to finish by asking normal questions, and saves a polished PDF you'd be happy to sell.
<code>/sales-page</code>	"build my sales page"	The page that does the selling — headline, benefits, objections, FAQ — in your voice.
<code>/email-messaging</code>	"write my welcome emails"	Your delivery email plus a welcome sequence, and DM scripts if you want them.
<code>/content-creator</code>	"make me a week of content"	A week of faceless content — captions, hooks, images, and finished reels rendered for you , ready to schedule.
<code>/launch-checklist</code>	"am I ready to launch?"	A ☒ / ☐ checklist of what's left, in order, plus a calm launch-day plan.
<code>/setup-connections</code>	"connect my accounts and go live"	The big one. Walks you through payments, product delivery, phone alerts, your customer-service inbox, ads, and content posting — one at a time, testing each as you go.

● Grow & run

Command	Or just say...	What happens
<code>/meta-ads</code>	"set up my Meta ads"	Writes your ads in several different angles , renders image and silent-reel creative, plans any talking-head ads, then builds the campaign in your own ad account — always paused . After that it checks your numbers daily and messages your phone with what to keep, cut, or scale.
<code>/upsells</code>	"help me make more per sale"	Designs an order bump or upsell so you earn more from traffic you already have.
<code>/business-dashboard</code>	"how am I doing?"	Your numbers in plain English, and the single highest-leverage next move.
<code>/customer-support</code>	"help me answer my customers"	Reads your support inbox, tells you what's waiting, and drafts a warm reply to each in your voice. You approve before anything sends.

Auto-Pilot exclusives — these two don't exist in the Co-Pilot edition.

<code>/finance-agent</code>	"help me with my books"	Keeps your bookkeeping tidy in plain English — categorizes expenses, tracks profit, answers tax questions, and gets you ready for your accountant.
<code>/health-check</code>	"is everything running?"	Checks every connection, your scheduled jobs, and any undelivered sales — then tells you what's good and fixes what isn't. Run it any time something <i>feels</i> off.

● What runs on its own

This is what you actually paid for. Once connected, all of this happens without you asking — and you can turn any of it on or off at any time by just saying so.

The content engine — a full week, made for you

Runs	When	What happens
Research your niche	Weekly	Searches the web for what's actually working right now in your niche — the angles landing this month, hook lines stopping scrolls, and just as usefully, what's gone stale and overused. Saves it so the writer builds on current reality, not last year's playbook.
Plan & write the week	Weekly	Writes a complete week of content in your voice — every format, hooks and captions included — grounded in that research plus your audience, product and brand profile. You wake up to a finished plan instead of a blank page.

Render the images	Weekly	Turns that plan into finished branded graphics in the right sizes for feed and stories. Your fonts, your colours, no design work.
Render the reels	Weekly	Builds actual MP4 reels — text overlays, motion, timing — ready to post. You add trending audio in the app so the platform rewards it.
Post it	Daily	Publishes the queue to Facebook and Instagram on schedule. Stays in preview mode until you personally decide to go live — nothing publishes before then.

The ads engine — set up once, watched daily

Runs	When	What happens
Plan & write the ads	On request	Ad copy in several different angles , plus the image and silent-reel creative rendered for you, and a shot-by-shot plan for any talking-head ads you want to film.
Build the campaign	On request	Creates the campaign, ad set and ads in your own ad account — targeting, budget, tracking, buyer-exclusions and all. Always paused . Done once, not weekly: your ad set keeps its learning that way.
Add new creative	Weekly	Picks up finished ads you've dropped in the folder and loads them into the running ad set as paused ads, ready for you to switch on.
Check & advise	Daily	Reads yesterday's numbers and messages your phone: what to keep, what to cut, what to put more behind — each with the reason. It recommends; it never changes or spends anything.

Sales, money & the watchdog

Runs	When	What happens
Sale watcher	Hourly	Spots a new sale, emails the buyer their product, adds them to your CRM and tags them so your onboarding emails fire — then messages your phone confirming the delivery actually happened , not just that you made a sale. If any link breaks, it says so loudly.
Weekly report	Weekly	A short summary on your phone: what sold, what's working, and the one thing worth looking at.

Health check	Weekly	Quietly confirms every connection, every scheduled job, and that no sale went undelivered — then tells you what's good and fixes what isn't, before you'd ever have noticed.
Finance report	Weekly	Your week in real numbers, sent to your phone: revenue, sales, average order, refunds, expenses and profit — with last week's comparison. Real figures from Stripe only; nothing estimated or projected.
Your books	Ask any time	Say <i>"help me with my books"</i> and your Finance Assistant categorizes expenses, tracks profit, answers tax questions and gets you ready for your accountant.

The weekly rhythm, in one sentence. Your content gets planned, written, rendered and queued while you sleep; your ads get checked every morning and reported to your phone; every sale gets delivered and confirmed within the hour; and once a week you get a report telling you what worked. **Your job is to approve things and decide what you want next.**

Three honest limits, so nothing surprises you. **1.** Local automations only run when *your computer is on and awake* during the working hours you chose. Nothing runs on a closed laptop — say the word and we'll pick hours that match your real life. **2.** Your assistant *recommends* on ads; it never spends, enables, or changes anything on its own. Every campaign it builds arrives **paused**, and every optimization waits for your yes. **3.** The unattended weekly content writer needs its own API key in your `.env` (about a dollar or two a month in usage). Without it nothing breaks — you just plan your content *with* your assistant instead of waking up to it already done. Your assistant will offer to set this up when you're ready.

● If you'd rather type it directly

Optional — the plain-English versions above do all of this. Run these from your business folder.

```
node system/content-research.js → research what's working right now
node system/auto-content.js → write next week's content plan now
node system/render-content.js → render the images for that plan
node system/render-reels.js → render the reels
node system/social-post.js → post the queue (preview unless you went live)
node system/meta-ads.js check → is my ad account + pixel ready?
node system/meta-ads.js upload → load new ad creative (paused)
node system/meta-ads.js monitor → today's ad recommendations
node system/check-sales.js → check for sales right now
node system/weekly-digest.js → send this week's report
node system/health-check.js → is everything connected?
node system/test-telegram.js → test my phone alerts
node system/schedule-automation.js list → what's scheduled right now
```

The one rule that makes this easy. There are no special commands to memorize and nothing you can break by asking. If you're stuck, unsure, or want something changed — working hours, a budget, a typo in your product, turning something off — just say it however you'd say it out loud. That's the whole interface.
